## Introduction:

As our research group for some time ago is involved in the chemistry of quinazolone derivatives ${ }^{1-3}$ due to their importance in biological activity as antihypertensive, ${ }^{4}$ antifibrillatory, choleretic, antiphlogistic, ${ }^{5}$ antimitotic anticancer, ${ }^{6}$ antifungal ${ }^{7,}, 8$ and anticonvulsant agents. ${ }^{9}$ Quinazolinones were reported to possess diverse pharmacological activities such as CNS depressant, ${ }^{10}$ hypnotic, antiinflamatory, ${ }^{11}$ antitumor, ${ }^{12}$ muscle relaxants ${ }^{13}$ and for their antineoplastic activity. ${ }^{14}$ So, it is our goal to extend our study in this area to explore the reactivity of 3 -phenylquinazoline- $2,4(1 \mathrm{H}, 3 \mathrm{H})$-dithione (1) ${ }^{15}$ and 3-amino-6,8-dibromo-2-thioxo-2,3-dihydro- 1 H -quinazolin-4-one (7) towards different reagents to synthesize some new derivatives for testing their biological activities.

## RESULTS AND DISCUSSION

Reaction of 3-phenylquinazoline-2,4(1H,3H)dithione (1) ${ }^{15}$ with (2,3,4,6-tetra-O-acetyl- $\alpha$-D-glucopyranosyl)bromide ( $\square$-ABG) in the presence of triethyl amine in DMF at room temperature afforded the corresponding S nucleoside 2. Deblocking of 2 using sodium methoxide at r.t. yielded the starting aglycone, ${ }^{1,16}$ and not the desired deblocked compound 3-phenyl-2-((2R,3S,4R,5R)-3,4,5-trihydroxy-6-(hydroxymethyl)tetrahydro-2H-pyran-2-
ylthio)quinazoline-4(3H)-thione (2a). Its IR spectrum showed the $\mathrm{C}=\mathrm{O}$ at $1748 \mathrm{~cm}^{-1}$ and its ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum showed a singlet $\left(12 \mathrm{H}, 4 \mathrm{CH}_{3}\right)$ at 1.96 ppm and its MS showed the $\operatorname{EI}\left(\mathrm{M}^{+}\right)$at 600.25 . S-alkylation of compound 1 could be achieved by its treatment with alkylating agents namely: methyl iodide, benzyl chloride and /or phenacyl

Its IR spectrum showed the $(\mathrm{C}=\mathrm{O})$ ketone at 1665 and the (CO) ester at $1742 \mathrm{~cm}^{-1}$, its ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum showed a triblet 3 H of $\left(\mathrm{CH}_{3}\right)$ at 1.64 , quartet $2 \mathrm{H}\left(\mathrm{CH}_{2}\right)$ at 3.41 and a singlet $(\mathrm{CH})$ at 3.95 ppm . Refluxing of compound $\mathbf{1}$ with diphenyl diazomethane (prepared according to known method) ${ }^{17}$ in anhydrous benzene for 6 hr gave 2-(benzhydrylthio)-3-phenyl quinazoline-4(3H)-thione (6) as the sole product (tlc) and not $6 \mathbf{a}$ or $\mathbf{6 b}$ (Scheme 2). The structures $6 \mathbf{a}$ and $6 \mathbf{b}$ were ruled out based on different spectroscopic data. The IR spectrum of 6 showed the disappearance of SH at $1653 \mathrm{~cm}^{-1}$, while appearance of SCH at $2927 \mathrm{~cm}^{-1}$ and its ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum showed a singlet $(\mathrm{CH})$ at 3.51 ppm . and its MS showed the $\mathrm{m} / \mathrm{z}\left(\mathrm{M}^{+}\right.$ ) at 436.59.

## BIOLOGICAL ACTIVITY

Antimicrobial activity of some selected compounds (4a and 5) were determined against Escherichia coli (NCIM2065) as gram-negative bacteria, S. ureus as grampositive bacteria and Candida albicans as fungi. The inhibition zones were measured in triplicates by standard methods using Cut plug method. ${ }^{18,19}$ It was found compound 5 exhibited the highest inhibition zone against E. coli.

## Conclusion

In this work. It is reported the preparation of some new quinazoline-4-ones derivatives for testing their biological activity bactericides. The results indicated that some of them showed activity against different types of bacteria.
